

COMPOSTABLE FOOD SERVICEWARE BUYING GUIDE

July 2020

Created in collaboration with
the Wellfleet Recycling Committee and Woods Hole Sea Grant

COMPOSTABLE FOOD SERVICWARE BUYING GUIDE

PURPOSE

The goal of this buying guide is to encourage restaurants and other food service businesses to use non-plastic disposable food serviceware when durable serviceware is not an option. This guide is a living document which will be updated periodically as new products become available.

In creating this guide, we chose disposable serviceware products with minimal adverse environmental and human health effects, to the best of our knowledge. These products are alternatives to petroleum-based plastic, which is a known human and environmental health hazard. Resources we used to evaluate products are provided below.

This guide is not an endorsement of these products. Only you can determine if these products meet your needs; most vendors do offer samples to help you evaluate products. We welcome your comments and suggestions since this guide is a work in progress. Please email us at hello@takecarecapcod.org.

RECOMMENDATIONS

Reusable/durable washable serviceware is the most sustainable option for in-house and nearby dining. Durables use far less energy and resources over their lifetime, reduce waste sent to the landfill, and reduce litter in our streets, waterways, and oceans. For ideas and guidance on incorporating durable serviceware into your business, download the *Reusable Food Serviceware Guide 2015* from the RethinkDisposable.org website.

When reusables are not an option, single-use compostable serviceware is the next-best sustainable option, when composted along with your food waste. We recommend compostable products made from lined paperboard, molded fiber lined with PLA (a plant-based plastic substitute), bamboo, palm leaf, birch wood, and PLA (cutlery only).

PLA is compostable in industrial/commercial compost facilities only, due to the high temperatures needed for PLA to break down. However, too much PLA can be problematic for composting operations. We recommend avoiding PLA cups and food containers, and only using PLA cutlery, cup lids, and PLA-lined products.

Commercial composters accept compostable products that are certified by the Biodegradable Products Institute (BPI). [Black Earth](http://BlackEarth.com) is a commercial and residential compost hauler planning to start service on Cape Cod in 2020. Commercial composters accept compostable products certified by the Biodegradable Products Institute (BPI). The Compost Manufacturing Alliance (CMA) is an organization that provides field disintegration testing for food service products.

BUYING GUIDE CONTENT

This version of the buying guide provides a few examples of compostable cold & hot cups, soup containers, plates, food trays/boats, to-go food containers, cutlery, food/deli wrap, cutlery, and straws.

The product information and pricing listed is from the vendor links provided as of June 2020. The pricing is per item for the quantity buy specified.

In the future we would like to add more products, further research food serviceware certifications, and provide bulk-buying pricing from local distributors. We also hope to incorporate your feedback on the products listed and on products that you recommend.

COMPOSTABLE PRODUCTS DO'S & DON'TS

CHOOSE	AVOID
Products that are BPI and/or CMA certified.  	Products that claim to be “degradable” or “biodegradable” or make vague claims that are not certified by a third party.
Paperboard products made from clay-coated paper, or lined with a bio-wax or PLA	Paperboard products lined with plastic, which are not compostable
Molded Fiber products lined with PLA	Unlined Molded Fiber , which is usually treated with unsafe fluorinated chemicals (PFAS)
Bamboo, Palm leaf, or Birch wood products, which are naturally moisture proof	Clear PLA cups and food containers because compost farms can't handle too much of it and because it can contaminate recycling
Cutlery made from PLA as a lower cost alternative to bamboo, palm leaf, or birch wood.	Plastic-lined paper products or plastic cutlery , which contaminates compost

GLOSSARY

PLA - Polylactic Acid, plant-based plastic substitute made from fermented starch such as corn

PFAS - per- and polyfluoroalkyl substances

BIO-WAX - plant-based wax from soy or bees, alternative to petroleum-based wax

KRAFT PAPER - unbleached paper, chlorine-free

RENEWABLE RESOURCE - made from plants, not petroleum-based

RECYCLED CONTENT - percent of recycled content used in addition to new material

CERTIFICATIONS

BPI - Biodegradable Products Institute

CMA - Compost Manufacturers Association

FSC - Forest Stewardship Council

SFI - Sustainable Forestry Initiative
